

SHARON MWANGI

Junior Full Stack Developer

+254 742 386 462 · mwangiiisharon@gmail.com · Nairobi, Kenya · github.com/Wangariiisharon · [Portfolio](#)

PROFILE

Frontend-focused Software Engineer with 2 years of production experience building and maintaining web applications using React, Next.js, TypeScript, JavaScript, HTML5, and CSS3. Experienced working remotely with distributed teams, integrating REST APIs and GraphQL services, working with PostgreSQL and Firebase, testing features, and resolving defects. I particularly enjoy roles where I can work directly with users and clients, understand their requirements, and translate them into practical, working solutions.

TECHNICAL SKILLS

Frontend: React, Next.js, TypeScript, JavaScript (ES6+), HTML5, CSS3, responsive and cross-browser development

Backend & Data: Supabase (PostgreSQL), Firebase (NoSQL), RESTful API integration, Gemini API integration, currently expanding into Node.js

Tools & Practices: Git and GitHub (including full-history cleanup with git filter-repo), CI/deployment troubleshooting on Vercel, manual and cross-browser QA testing, code documentation for handover

Ways of Working: Async, written-first communication across distributed teams; iterative, sprint-style delivery with proactive written status updates in place of live stand-ups

EXPERIENCE

Full-stack Developer, Norah Digital April 2025 – January 2026

Remote, fully distributed team

- Led the technical direction and development approach for client projects, from initial build decisions through to what shipped.
- Built and maintained production web interfaces (Next.js, Sanity CMS), translating requirements and content into clean, responsive components
- Implemented analytics instrumentation and queried the underlying data, translating results into plain-language updates so non-technical clients understood exactly what their numbers meant
- Diagnosed and resolved a reliability issue in the deployment pipeline, a stale framework preset misconfiguration, by tracing it to the root cause and testing the fix across environments rather than patching around it
- Maintained clean, documented code and git history across several concurrent projects, including a full repository cleanup using git filter-repo
- Worked fully async in an iterative, sprint-style workflow, sending proactive written updates so nothing depended on a live call to stay on track

Fullstack Developer, Gessic July 2023 – February 2025

Nairobi, Kenya, Remote

- Designed and built dynamic frontend components for dashboard analytics, trip management, and vehicle tracking, connecting live backend data to clear, reliable visual interfaces
- Translated business requirements and messy source data into clean, functioning layouts across React and TypeScript applications
- Worked directly with backend data access and authentication flows, building a working understanding of how enterprise data structures and APIs connect to the interfaces people actually use
- Tested and fixed bugs and visual inconsistencies across the frontend as part of day-to-day ownership of shipped features, flagging issues during internal review before they reached clients
- Worked directly with non-engineering stakeholders to turn reporting needs into working technical solutions, explaining tradeoffs in plain terms

PROJECTS

- **AskTheVault:** a retrieval-augmented document search application built on Supabase for storage and the Gemini API for generation, direct experience wiring a database and an AI API into a working product end to end.

- **VidMetrics:** an analytics dashboard turning raw YouTube competitor data into clear, at-a-glance metrics such as subscribers, likes, and engagement.
- **SongaTrack:** contributed to a real-time fleet tracking dashboard, streaming live vehicle location data into a clean, readable interface.
- **Job Aggregation Platform (ongoing):** full-stack tool built with Next.js, TypeScript, and Firebase, structuring real-time data pulled from REST APIs and RSS feeds for clean, reliable display.
